NAME

unformat – Unformat 'espretty' formated Eiffel class files

SYNOPSIS

unformat -f ansi | html | latex | mime | mif | rtf <*file...*>

DESCRIPTION

unformat is a Perl script, which reformats by *espretty*
generated **ansi**, **html**, **latex**, **mime**, **mif** or **rtf** Eiffel class files back into pure ascii Eiffel classes. The new generated Eiffel class files get automatically the name of the supplied input files with a replaced *.e'* extension.

OPTIONS

-f ansi | html | latex | mime | mif | rtf
This option indicates the format type of the input files.

<file...>
A list of input files to process.

EXAMPLES

To unformat all HTML files in the current directory:

```
unformat -f html *.htm
```

or to unformat some RTF class files:

```
unformat -f rtf  file1.rtf file2.rtf file3.rtf
```

SEE ALSO

espretty(1), espp(1)

NOTES

The processing of FrameMaker 'mif' files takes much more time compared to the processing of other formated files. This is normal behaviour.
