Octave Quick Reference Octave Version 1.1.1

Starting Octave

octave start interactive Octave session octave file run Octave on commands in file octave --help describe command line options

Stopping Octave

quit or exit

INTERRUPT (e.q. C-c) terminate current command and

return to top-level prompt

Getting Help

list all commands and built-in variables help

help command briefly describe command

help -i use Info to browse Octave manual

help -i command search for command in Octave manual

Motion in Info

SPC or C-v scroll forward one screenful DEL or M-v scroll backward one screenful

C-1 redraw the display

Node Selection in Info

select the next node select the previous node select the 'up' node select the 'top' node select the directory node

select the first node in the current file select the last node in the current file reads the name of a node and selects it

kills the current node

Searching in Info

search for a string

C-s search forward incrementally search backward incrementally

search index & go to corresponding node go to next match from last 'i' command

Command-Line Cursor Motion

С-Ъ move back one character C-f move forward one character move the the start of the line C-a С-е move to the end of the line M-f move forward a word M-b move backward a word

C-1 clear screen, reprinting current line at top

Inserting or Changing Text

M-TAB insert a tab character

DEL delete character to the left of the cursor C-ddelete character under the cursor add the next character verbatim C-v $C-\pm$ transpose characters at the point

transpose words at the point

surround optional arguments ... show one or more arguments

Copyright 1996, John W. Eaton Permissions on back

Killing and Yanking

C-k kill to the end of the line С-у vank the most recently killed text M-dkill to the end of the current word M-DEL kill the word behind the cursor M - A rotate the kill ring and vank the new top

J TI: . 4

Command Cor	npletion and History
TAB	complete a command or variable name
M-?	list possible completions
RET	enter the current line
C-p	move 'up' through the history list
C-n	move 'down' through the history list
M -<	move to the first line in the history
M->	move to the last line in the history
C-r	search backward in the history list
C-s	search forward in the history list
history $\left[ext{-q} \right] \left[N ight]$	list N previous history lines, omitting history numbers if -q
history - $f w$ $igl[fileigr]$	write history to file (~/.octave_hist if no file argument)
history -r $igl[fileigr]$	<pre>read history from file (~/.octave_hist if no file argument)</pre>
edit_history lines	edit and then run previous commands from the history list
run_history lines	run previous commands from the history

commands to edit or run. If beg is greater than end, reverse the list of commands before editing. If end is omitted, select commands from beg to the end of the history list. If both arguments are omitted, edit the previous item in the history list

Specify the first and last history

Shell Commands

 $\begin{bmatrix} beq \end{bmatrix} \begin{bmatrix} end \end{bmatrix}$

$\operatorname{\mathbf{cd}} dir$	change working directory to dir
pwd	print working directory
ls [options]	print directory listing
getenv (string)	return value of named environment
	variable
svstem(cmd)	execute arbitrary shell command strip

Matrices

Square brackets delimit literal matrices. Commas separate elements on the same row. Semicolons separate rows. Commas may be replaced by spaces, and semicolons may be replaced by one or more newlines. Elements of a matrix may be arbitrary expressions, provided that all the dimensions agree.

$[x, y, \dots]$	enter a row vector
$[x; y; \dots]$	enter a column vector
[w , x ; y , z]	enter a 2 X 2 matrix

Ranges

base: limit base: incr: limit

Specify a range of values beginning with base with no elements greater than limit. If it is omitted, the default value of incr is 1. Negative increments are permitted.

Strings and Common Escape Sequences

A string constant consists of a sequence of characters enclosed in either double-quote or single-quote marks.

//	a literal backslash
/"	a literal double-quote character
	a literal single-quote character
\n	newline, ASCII code 10
\t	horizontal tab. ASCII code 9

Index Expressions

var (idx)	select elements of a vector
var ($idx1$, $idx2$)	select elements of a matrix
scalar	select row (column) corresponding to
	scalar
vector	select rows (columns) corresponding to the
	elements of <i>vector</i>
range	select rows (columns) corresponding to the
	elements of range
:	select all rows (columns)

Global Variables

global var1 . . . Declare variables global. Global variables may be accessed inside the body of a function without having to be passed in the function parameter list provided they are also declared global within the function.

Salacted Built-in Variables

perecred Danie.	-III variabies
EDITOR	editor to use with edit_history
Inf, NaN	IEEE infinity, NaN
LOADPATH	path to search for function files
PAGER	program to use to paginate output
ans	last result not explicitly assigned
eps	machine precision
pi	π
realmax	maximum representable value
realmin	minimum representable value

automatic_replot	automatically red
do_fortran_indexing	Fortran-style ind
implicit_str_to_num_ok	allow strings to l
output_max_field_width	maximum numer
output_precision	min significant fi
page_screen_output	control whether
prefer_column_wectors	create column ve
resize_on_range_error	automatic resizin
save_precision	digits stored by
silent_functions	suppress output
arn_divide_by_zero	suppress divide b

draw plots lexing of matrices become numbers ric field width igures displayed output is paged ectors by default ng of matrices save command from functions by zero errors

commas_in_literal_matrix

control handling of spaces in matrices

ignore_function_time_stamp

ignore changes in function files during session

ok_to_lose_imaginary_part

allow complex to real conversion

prefer_zero_one_indexing

if ambiguous, prefer 0-1 style indexing

Arithmetic and Increment Operators

x + y	addition
x - y	subtraction
x * y	matrix multiplication
x .* y	element by element multiplication
x / y	right division, conceptually equivalent to
	(inverse(y') * x')'
x ./ y	element by element right division
$x \setminus y$	left division, conceptually equivalent to
	inverse (x) * y
$x \cdot y$	element by element left division
$x \hat{y}$	power operator
x . \hat{y}	element by element power operator
- x	negation
+ x	unary plus (a no-op)
x,	complex conjugate transpose
x .,	transpose
++ x (x)	increment (decrement) x, return new value
x ++ (x)	increment (decrement) x_1 return old value

Assignment Expressions

var = expr	assign expres	ssion to variable
var (idx) = expr	assign expres	ssion to indexed variable

Comparison and Boolean Operators

These operators work on an element-by-element basis. Both arguments are always evaluated.

x < y	true if x is less than y
$x \leq y$	true if x is less than or equal to y
x == y	true if x is greater than y
x >= y	true if x is greater than or equal to y
x > y	true if x is equal to y
x != y	true if x is not equal to y
x & y	true if both x and y are true
$x \mid y$	true if at least one of x or y is true
! bool	true bool is false

Short-circuit Boolean Operators

Operators evaluate left-to-right, expecting scalar operands. Operands are only evaluated if necessary, stopping once overall truth value can be determined. Operands are converted to scalars by applying the all function.

x &&	y	${\tt true}$	if	both x a	nd y	y are	true	
$x \mid \cdot \mid$	y	${\tt true}$	if	at least	one	of x	or y	is true

Operator Precedence

Here is a table of the operators in $\ensuremath{\mathsf{Octave}},$ in order of increasing precedence.

; ,	statement separators
=	assignment, groups left to right
& &	logical "or" and "and"
&	element-wise "or" and "and"
< <= == >= > !=	relational operators
:	colon
+ -	addition and subtraction
* / \ .* ./ .\	multiplication and division
, ,	transpose
+ - ++ !	unary minus, increment, logical "not"
^ .^	exponentiation

Statements

for identifier = expr stmt-list endfor

Execute *stmt-list* once for each column of *expr*. The variable *identifier* is set to the value of the current column during each iteration.

while (condition) stmt-list endwhile

Execute stmt-list while condition is true.

break	exit innermost loop	
continue	go to beginning of innermost loop	
return	return to calling function	

if (condition) if-body [else else-body] endif

Execute if-body if condition is true, otherwise execute elsebody.

if (condition) if-body [elseif (condition) elseif-body] endif

Execute if-body if condition is true, otherwise execute the elseif-body corresponding to the first elseif condition that is true, otherwise execute else-body.

Any number of ${\tt elseif}$ clauses may appear in an ${\tt if}$ statement.

unwind_protect body unwind_protect_cleanup cleanup end

Execute body. Execute cleanup no matter how control exits body.

Defining Functions

```
 \begin{array}{c} \textbf{function} \left[ ret\text{-}list \right] function\text{-}name \left[ \left. (arg\text{-}list) \right. \right] \\ function\text{-}body \\ \textbf{endfunction} \end{array}
```

ret-list may be a single identifier or a comma-separated list of identifiers delimited by square-brackets.

arg-list is a comma-separated list of identifiers and may be empty.

Basic Matrix Manipulations

rows (a)	return number of rows of a
columns (a)	return number of columns of a
all (<i>a</i>)	check if all elements of a nonzero
any (a)	check if any elements of a nonzero
find(a)	return indices of nonzero elements
sort (a)	order elements in each column of a
sum(a)	sum elements in columns of a
prod (a)	product of elements in columns of a
min (args)	find minimum values
max (args)	find maximum values
rem(x, y)	find remainder of x/y
reshape (a , m , n)	reformat a to be m by n

diag(v, k)	create diagonal matrices		
linspace (b , l , n)	create vector of linearly-spaced elements		
logspace (b , l , n)	create vector of log-spaced elements		
eye (n , m)	create n by m identity matrix		
ones (n, m)	create n by m matrix of ones		
zeros (n, m)	create n by m matrix of zeros		
rand(n, m)	create n by m matrix of random values		

Linear Algebra

O	
${ t chol}$ (a)	Cholesky factorization
\det (a)	compute the determinant of a matrix
eig (<i>a</i>)	eigenvalues and eigenvectors
expm (a)	compute the exponential of a matrix
hess (a)	compute Hessenberg decomposition
inverse (a)	invert a square matrix
norm (a, p)	compute the p-norm of a matrix
pinv (a)	compute pseudoinverse of a
qr (a)	compute the QR factorization of a matrix
rank(a)	matrix rank
schur (a)	Schur decomposition of a matrix
svd (a)	singular value decomposition
$ extsf{syl}$ (a, b, c)	solve the Sylvester equation

Equations, ODEs, DAEs, Quadrature

*ISOIVe	soive nonlinear algebraic equations
*lsode	integrate nonlinear ODEs
*dassl	integrate nonlinear DAEs
*quad	integrate nonlinear functions

* See the on-line or printed manual for the complete list of arguments for these functions.

Signal Processing

fft (a)	Fast Fourier Transform using FFTPACK
ifft (a)	inverse FFT using FFTPACK
freqz (<i>args</i>)	FIR filter frequency response
sinc(x)	returns sin $(\pi x)/(\pi x)$

Image Processing

${ t colormap}$ (map)	set the current colormap
gray2ind(i, n)	convert gray scale to Octave image
image (img, zoom)	display an Octave image matrix
imagesc (img, zoom)	display scaled matrix as image
imshow (img , map)	display Octave image
imshow (i , n)	display gray scale image
imshow (r , g , b)	display RGB image
ind2gray (imq, map)	
indig ting, map	convert Octave image to gray scale
ind2rgb (img, map)	convert Octave image to gray scale convert indexed image to RGB
0 , 0 ,	0 0 .
ind2rgb (img, map)	convert indexed image to RGB

Sets

$create_set(a, b)$	create row vector of unique values
$ exttt{complement}$ (a , b)	elements of b not in a
intersection (a , b)	intersection of sets a and b
union (a , b)	union of sets a and b

Strings

strcmp(s,	t)	compare strings
strcat (s.	t)	concatenate strings

C-style Input and Output

fopen (name, mode) open file name fclose (file) close file printf (fmt, ...) formatted output to stdout fprintf (file, fmt, ...) formatted output to file sprintf(fmt, ...)formatted output to string scanf(fmt)formatted input from stdin fscanf (file. fmt) formatted input from file sscanf (str, fmt) formatted input from string fgets (file, len) read len characters from file fflush (file) flush pending output to file ftell (file) return file pointer position frewind (file) move file pointer to beginning freport print a info for open files fread (file, size, prec) read binary data files fwrite (file, size, prec) write binary data files feof (file) determine if pointer is at EOF

A file may be referenced either by name or by the number returned from **fopen**. Three files are preconnected when Octave starts: **stdin**, **stdout**, and **stderr**.

Other Input and Output functions

save file var ...save variables in fileload fileload variables from filedisp (var)display value of var to screen

Miscellaneous Functions

eval (str) evaluate str as a command evaluate function named by str, passing remaining args to called function error (message) print message and return to top level

clear pattern clear variables matching pattern exist (str) check existence of variable or function who list current variables

companion matrix

nst current variable

Polynomials compan (p)

conv(a, b)convolution deconv(a, b)deconvolve two vectors poly (a) create polynomial from a matrix polyderiv (p) derivative of polynomial polyreduce (p) integral of polynomial polyval (p, x)value of polynomial at xpolyvalm (p, x) value of polynomial at xroots (p) polynomial roots residue (a, b) partial fraction expansion of ratio a/b

Statistics

corrcoef (x, y)correlation coefficientcov (x, y)covariancemean (a)mean valuemedian (a)median valuestd (a)standard deviationvar (a)variance

Basic Plotting

```
    gplot [ranges] expr [using] [title] [style]
    2D plotting

    gsplot [ranges] expr [using] [title] [style]
    3D plotting

    ranges specify data ranges expr expr expression to plot using specify columns to plot
```

 expr
 expression to plot

 using
 specify columns to plot

 title
 specify line title for legend

 style
 specify line style

If ranges are supplied, they must come before the expression to plot. The using, title, and style options may appear in any order after expr. Multiple expressions may be plotted with a single command by separating them with commas.

 set options
 set plotting options

 show options
 show plotting options

 replot
 redisplay current plot

automatic_replot built-in variable

Other Plotting Functions

```
plot (aras)
                    2D plot with linear axes
semilogx (args)
                    2D plot with logarithmic x-axis
semilogy (args)
                    2D plot with logarithmic y-axis
loglog (args)
                    2D plot with logarithmic axes
bar (args)
                    plot bar charts
stairs (x, y)
                    plot stairsteps
hist (y, x)
                    plot histograms
title (string)
                    set plot title
axis (limits)
                    set axis ranges
xlabel (string)
                    set x-axis label
ylabel (string)
                    set y-axis label
grid on off
                    set grid state
hold on off
                    set hold state
ishold
                    return 1 if hold is on, 0 otherwise
mesh (x, y, z)
                    plot 3D surface
meshdom(x, y)
                    create mesh coordinate matrices
```
