Octave Quick Reference Octave Version 1.1.1

Starting Octave

octave	start interactive Octave session
${ t octave} \; file$	run Octave on commands in file
octavehelp	describe command line options

Stopping Octave

INTERRUPT	(e.g.	C-c) t	erm	inate cur	rent	command	
	and	return	to	top-level	pron	npt	

Getting Help

nerp	nst an commands and bunt-in variables
help command	briefly describe command
help -i	use Info to browse Octave manual
help -i command	search for command in Octave manual

list all commands and built in variables

Motion in Info

SPC or C-v	scroll forward one screenful
DEL or M-v	scroll backward one screenfu
C-1	redraw the display

Node Selection in Info

n	select the next node
p	select the previous node
u	select the 'up' node
t	select the 'top' node
d	select the directory node
<	select the first node in the current file
>	select the last node in the current file
g	reads the name of a node and selects it
C-x k	kills the current node

Searching in Info

s	search for a string	Cu aii
C-s	search forward incrementally	baq
C-r	search backward incrementally	ls [options]
i	search index & go to corresponding node	getenv (string)
,	go to next match from last 'i' command	•
		gwg+om (omd)

clear screen, reprinting current line at top

Command-Line Cursor Motion

C-b	move back one character
C-f	move forward one character
C-a	move the the start of the line
C-e	move to the end of the line
M-f	move forward a word
M-b	move backward a word
C-1	clear screen, reprinting current li

Inserting or Changing Text

M-TAB	insert a tab character
DEL	delete character to the left of the cursor
C-d	delete character under the cursor
C-v	add the next character verbatim
C-t	transpose characters at the point
M-t	transpose words at the point

]	surround optional	arguments		show	one	or	more	argumei	ıts
	Copyright 1996	John W. Eat	on	Ре	rmis	sioı	ıs on	back	

Killing and Yanking

C-k	kill to the end of the line
C-y	yank the most recently killed text
M-d	kill to the end of the current word
M-DEL	kill the word behind the cursor
M-y	rotate the kill ring and yank the new top

Command Completion and History

Command Cor	npietion and nistory
TAB	complete a command or variable name
M-3	list possible completions
RET	enter the current line
C-p	move 'up' through the history list
C-n	move 'down' through the history list
M-<	move to the first line in the history
M->	move to the last line in the history
C-r	search backward in the history list
C-s	search forward in the history list
$\texttt{history} \; \big[\text{-q} \big] \; \big[N \big]$	list N previous history lines, omitting
г 1	history numbers if -q
history -w $[file]$	write history to file ("/.octave_hist if no file argument)
$\verb history-r [file] $	read history from file ("/.octave_hist if no file argument)
edit_history lines	edit and then run previous commands from the history list
run_history lines	run previous commands from the history list
$\begin{bmatrix} beg \end{bmatrix}\begin{bmatrix} end \end{bmatrix}$	Specify the first and last history

commands to edit or run. If beg is greater than end, reverse the list of commands before editing. If end is omitted, select commands from beg to the end of the history list. If both arguments are omitted, edit the previous item in the history list

Shell Commands

cd dir pwd	change working directory to dir print working directory
1s [options]	print directory listing
getenv (string)	return value of named environment variable
${ t system (cmd)}$	execute arbitrary shell command string

Matrices

Square brackets delimit literal matrices. Commas separate elements on the same row. Semicolons separate rows. Commas may be replaced by spaces, and semicolons may be replaced by one or more newlines. Elements of a matrix may be arbitrary expressions, provided that all the dimensions agree.

$[x, y, \dots]$	enter a row vector
$[x; y; \dots]$	enter a column vector
[w , x ; y , z]	enter a 2 X 2 matrix

Ranges

	_		
base	:	limit	
base	:	incr :	limit

Specify a range of values beginning with base with no elements greater than limit. If it is omitted, the default value of incr is 1. Negative increments are permitted.

Strings and Common Escape Sequences

A string constant consists of a sequence of characters enclosed in either double-quote or single-quote marks.

//	a literal backslash
\"	a literal double-quote character
\',	a literal single-quote character
\n	newline, ASCII code 10
\t	horizontal tab, ASCII code 9

Index Expressions

var (idx)	select elements of a vector
var ($idx1$, $idx2$)	select elements of a matrix
scalar	select row (column) corresponding to
	scalar
vector	select rows (columns) corresponding to the
	elements of vector
range	select rows (columns) corresponding to the
	elements of $range$
:	select all rows (columns)

Global Variables

global var1 Declare variables global.
Global variables may be accessed inside the body of a
function without having to be passed in the function

parameter list provided they are also declared global within the function.

Selected Built-in Variables

EDITOR	editor to use with edit_history
Inf, NaN	IEEE infinity, NaN
LOADPATH	path to search for function files
PAGER	program to use to paginate output
ans	last result not explicitly assigned
eps	machine precision
рi	π
realmax	maximum representable value
realmin	minimum representable value

automatic_replot
do_fortran_indexing
implicit_str_to_num_ok
output_max_field_width
output_precision
page_screen_output
prefer_column_vectors
resize_on_range_error
save_precision
silent_functions
warn_divide_by_zero

automatically redraw plots Fortran-style indexing of matrices allow strings to become numbers maximum numeric field width min significant figures displayed control whether output is paged create column vectors by default automatic resizing of matrices digits stored by save command suppress output from functions suppress divide by zero errors

commas_in_literal_matrix

control handling of spaces in matrices

ignore_function_time_stamp

ignore changes in function files during session

ok_to_lose_imaginary_part

allow complex to real conversion

prefer_zero_one_indexing

if ambiguous, prefer 0-1 style indexing

Arithmetic and Increment Operators

x + y	addition
x - y	subtraction
x * y	matrix multiplication
x .* y	element by element multiplication
x / y	right division, conceptually equivalent to (inverse (y') * x')'
x ./ y	element by element right division
$x \setminus y$	left division, conceptually equivalent to
	inverse (x) * y
$x \cdot \mathbf{y}$	element by element left division
x ~ y	power operator
x . ^ y	element by element power operator
- x	negation
+ x	unary plus (a no-op)
x,	complex conjugate transpose
x . ,	transpose
++ x (x)	increment (decrement) x, return new value
x ++ (x)	increment (decrement) x, return old value

Assignment Expressions

var	= expr	assign	${\tt expression}$	to	variable	
var	(idx) = expr	assign	expression	to	indexed	variable

Comparison and Boolean Operators

These operators work on an element-by-element basis. Both arguments are always evaluated.

$x \leq y$	true if x is less than y
$x \leq y$	true if x is less than or equal to y
x == y	true if x is greater than y
$x \ge y$	true if x is greater than or equal to y
x > y	true if x is equal to y
x != y	true if x is not equal to y
x & y	true if both x and y are true
$x \mid y$	true if at least one of x or y is true
! bool	true bool is false

Short-circuit Boolean Operators

Operators evaluate left-to-right, expecting scalar operands. Operands are only evaluated if necessary, stopping once overall truth value can be determined. Operands are converted to scalars by applying the all function.

Operator Precedence

Here is a table of the operators in Octave, in order of increasing precedence.

; ,	statement separators
=	assignment, groups left to right
& &	logical "or" and "and"
& &	element-wise "or" and "and"
< <= == >= > !=	relational operators
:	colon
+ -	addition and subtraction
* / \ .* ./ .\	multiplication and division
, ,	transpose
+ - ++ !	unary minus, increment, logical "not"
^ ,^	exponentiation

Statements

for identifier = expr stmt-list endfor
 Execute stmt-list once for each column of expr. The
 variable identifier is set to the value of the current column
 during each iteration.

while (condition) stmt-list endwhile

Execute stmt-list while condition is true.

break	exit innermost loop		
continue	go to beginning of innermost loop		
return	return to calling function		

if (condition) if-body [else else-body] endif

Execute if-body if condition is true, otherwise execute elsebody.

if (condition) if-body [elseif (condition) elseif-body] endif Execute if-body if condition is true, otherwise execute the

elseif-body corresponding to the first elseif condition that is true, otherwise execute else-body.

Any number of **elseif** clauses may appear in an **if** statement.

unwind_protect body unwind_protect_cleanup cleanup end

Execute body. Execute cleanup no matter how control exits body.

Defining Functions

```
 \begin{array}{c} \textbf{function} \ \left[ \textit{ret-list} \right] \ \textit{function-name} \ \left[ \left( \textit{arg-list} \right) \right] \\ \textit{function-body} \\ \textbf{endfunction} \\ \end{array}
```

ret-list may be a single identifier or a comma-separated list of identifiers delimited by square-brackets.

arg-list is a comma-separated list of identifiers and may be empty.

Basic Matrix Manipulations

Dasic Matrix	viampulations	
rows (a) columns (a)	return number of rows of a return number of columns of a	
all (<i>a</i>)	check if all elements of a nonzero	
any (a)	check if any elements of a nonzero	
find(a)	return indices of nonzero elements	
sort (a)	order elements in each column of a	
sum (a)	sum elements in columns of a	
prod (a)	product of elements in columns of a	
min (args)	find minimum values	
max (args)	find maximum values	
rem (x, y)	find remainder of x/y	
reshape (a , m , n)	n) reformat a to be m by n	
diag(v, k)	create diagonal matrices	
linspace (b , l , n)	create vector of linearly-spaced elements	
logspace (b , l , n)	create vector of log-spaced elements	
eye (n, m)	create n by m identity matrix	
ones (n , m)	create n by m matrix of ones	
zeros (n , m)	create n by m matrix of zeros	
rand(n, m)	create n by m matrix of random values	

Linear Algebra

chol (a)	Cholesky factorization
\det (a)	compute the determinant of a matrix
eig (<i>a</i>)	eigenvalues and eigenvectors
expm (a)	compute the exponential of a matrix
hess (a)	compute Hessenberg decomposition
inverse (a)	invert a square matrix
norm(a, p)	compute the p-norm of a matrix
pinv (a)	compute pseudoinverse of a
qr (a)	compute the QR factorization of a matrix
rank (a)	matrix rank
schur (a)	Schur decomposition of a matrix
s v d (a)	singular value decomposition
syl (a, b, c)	solve the Sylvester equation

Equations, ODEs, DAEs, Quadrature

*fsolve	solve nonlinear algebraic equations
*lsode	integrate nonlinear ODEs
*dassl	integrate nonlinear DAEs
*quad	integrate nonlinear functions

* See the on-line or printed manual for the complete list of arguments for these functions.

Signal Processing

fft (a)	Fast Fourier Transform using FFTPACK
ifft (a)	inverse FFT using FFTPACK
freqz ($args$)	FIR filter frequency response
sinc(x)	returns sin $(\pi x)/(\pi x)$

set the surrent colorman

Image Processing

colormap (map)	set the	current colormap
gray2ind(i, n)	convert	gray scale to Octave image
image (img, zoom)	$_{\rm display}$	an Octave image matrix
imagesc (img, zoom)	$_{\rm display}$	scaled matrix as image
imshow (img, map)	display	Octave image
imshow (i, n)	display	gray scale image
imshow (r, g, b)	display	RGB image
ind2gray (img , map)	convert	Octave image to gray scale
ind2rgb (img, map)	convert	indexed image to RGB
loadimage (file)	load an	image file
rgb2ind(r, g, b)	convert	RGB to Octave image
saveimage (file, img, fmt	, map)	save a matrix to file

Sets

$create_set(a, b)$ $complement(a, b)$	create row vector of unique values elements of b not in a
intersection (a, b) union (a, b)	intersection of sets a and b union of sets a and b

Strings

strcmp(s, t)	compare strings
strcat(s, t,)	concatenate strings

C-style Input and Output

fopen (name, mode) open file name fclose (file) close file printf (fmt, ...)formatted output to stdout fprintf (file, fmt, ...) formatted output to file sprintf (fmt, ...) formatted output to string scanf(fmt)formatted input from stdin fscanf (file, fmt) formatted input from file sscanf (str, fmt) formatted input from string fgets (file, len) read len characters from file fflush (file) flush pending output to file ftell (file) return file pointer position frewind (file) move file pointer to beginning freport print a info for open files fread (file, size, prec) read binary data files fwrite (file, size, prec) write binary data files feof (file) determine if pointer is at EOF

A file may be referenced either by name or by the number returned from fopen. Three files are preconnected when Octave starts: stdin, stdout, and stderr.

Other Input and Output functions

save file var ... save variables in file load file load variables from file disp (var) display value of var to screen

Miscellaneous Functions

eval(str)evaluate str as a command feval (str, ...) evaluate function named by str, passing remaining args to called function error (message) print message and return to top level clear pattern clear variables matching pattern exist (str) check existence of variable or function who list current variables

Polynomials

compan (p) companion matrix conv(a, b)convolution deconv(a, b)deconvolve two vectors poly (a) create polynomial from a matrix polyderiv (p) derivative of polynomial polyreduce (p) integral of polynomial polyval (p, x) value of polynomial at x polyvalm (p, x) value of polynomial at x roots (p) polynomial roots residue (a, b)partial fraction expansion of ratio a/b

Statistics

corrcoef(x, y)correlation coefficient cov(x, y)covariance mean (a) mean value median (a) median value std (a) standard deviation var (a) variance

Basic Plotting

gplot [ranges] expr [using] [title] [style] 2D plotting gsplot [ranges] expr [using] [title] [style] 3D plotting rangesspecify data ranges exprexpression to plot using specify columns to plot titlespecify line title for legend specify line style style

If ranges are supplied, they must come before the expression to plot. The using, title, and style options may appear in any order after expr. Multiple expressions may be plotted with a single command by separating them with commas.

set options set plotting options show options show plotting options replot redisplay current plot

closeplot close stream to gnuplot process purge_tmp_files clean up temporary plotting files

automatic_replot built-in variable

Other Plotting Functions

plot (args) 2D plot with linear axes semilogx (args) 2D plot with logarithmic x-axis semilogy (args) 2D plot with logarithmic y-axis loglog (arqs) 2D plot with logarithmic axes bar (args) plot bar charts stairs (x, y)plot stairsteps hist (y, x)plot histograms title (string) set plot title axis (limits) set axis ranges xlabel (string) set x-axis label ylabel (string) set y-axis label grid on off set grid state hold on off set hold state ishold return 1 if hold is on, 0 otherwise mesh (x, y, z)plot 3D surface meshdom (x, y)create mesh coordinate matrices
